DETAILED ACTION

Allowable Subject Matter

1. The following is the examiner's statement of reasons for allowable subject matter:

Claim 1 is allowed over the prior art of record because the examiner found neither prior art cited in its entirety, nor based on the prior art, found any motivation to combine any of the said prior art which teaches: An image reading apparatus comprising: an original placement portion on which an original is to be placed;

an optical unit provided below the original placement portion and configured to move relative to the original placement portion; and

a guide member that guides movement of the optical unit and supports the optical unit from below

wherein the optical unit includes a unit frame configured to hold an optical element, and includes a slider configured to slide on the guide member, said slider having a screw that is vertically threaded in a screw hole formed in the unit frame and that rides the guide member,

wherein a vertical position of the unit frame relative to the guide member is adjusted in accordance with a rotating amount of the screw, such that the optical element is thereby raised or lowered in order to adjust an imaging parameter of an output image;

Art Unit: 2625

wherein a plurality of projecting portions are provided on a root of a thread of the screw along a circumference of the thread, and are provided in an area other than a tip end area of the screw,

wherein each of the projecting portions of the screw are plastically deformable into a different shape and are plastically deformed while being screwed into the screw hole, and wherein the plastic deformation of the projecting portions of the screw.

Huang (7310171) discloses a document surface micro-adjust mechanism, wherein the micro-adjust mechanism for adjusting the distance of separation between the document surface and the lens of an optical scanner. Huang fails to disclose the invention as claimed especially wherein a vertical position of the unit frame relative to the guide member is adjusted in accordance with a rotating amount of the screw, such that the optical element is thereby raised or lowered in order to adjust an imaging parameter of an output image;

Tanaka (6053653) discloses an image reader and method for controlling the image reader capable of reading an image and a translucent original such as photographic film at high quality through self-advancement of a read unit provided with a reducing optical system. Tanaka fails to disclose the invention as claimed.

Tsunoda (4862218) discloses a supporting apparatus for an optical unit which is stably supported on a slider. Tsunoda fails to disclose the invention as claimed.

Art Unit: 2625

Claim 13, is allowed over the prior art of record because the examiner found neither prior art cited in its entirety, nor based on the prior art, found any motivation to combine any of the said prior art which teaches

an image reading apparatus comprising: an original illumination member;
a reflection system configured to reflect light from the original;

a scanning member configured to move the reflection system; a support surface configured to support the scanning member; and

a plurality of screws configured to be mounted in a plurality of screw holes formed on the scanning member, wherein a head of each of the screws slides in contact with the support surface;

wherein a vertical position of the scanning member relative to the support surface is adjusted in accordance with a rotating amount of the screw, such that an optical element is thereby raised or lowered in order to adjust an imaging parameter of an output_image and

wherein each of the screws has a plurality of plastically deformable projecting portions on a root of a thread thereof along a circumference of the thread, the projecting portions provided in an area other than a tip end area of the screw,

wherein each of the projecting portions of the screw are plastically deformable into a different shape and are plastically deformed while being screwed into the screw hole, wherein the plastic deformation of the projecting portions of the screw absorbs play in a mount portion between the screw and the

Art Unit: 2625

screw hole, and wherein the projecting portions and the screw hole engage each other in an interference fit in the axial direction of the screw.

Huang (7310171) discloses a document surface micro-adjust mechanism, wherein the micro-adjust mechanism for adjusting the distance of separation between the document surface and the lens of an optical scanner. Huang fails to disclose the invention as claimed especially wherein a vertical position of the unit frame relative to the guide member is adjusted in accordance with a rotating amount of the screw, such that the optical element is thereby raised or lowered in order to adjust an imaging parameter of an output image;

Tanaka (6053653) discloses an image reader and method for controlling the image reader capable of reading an image and a translucent original such as photographic film at high quality through self-advancement of a read unit provided with a reducing optical system. Tanaka fails to disclose the invention as claimed.

Tsunoda (4862218) discloses a supporting apparatus for an optical unit which is stably supported on a slider. Tsunoda fails to disclose the invention as claimed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled Comments on Statement of Reasons for Allowance.
